The var gene and the corresponding P. falciparum erythrocyte membrane protein 1 (PFEMP1) modulate adhesion of parasitized red blood cell (PRBC) to CSA. The protein and the encoding gene are useful for treating and preventing maternal malaria in a patient identified at a risk for contracting maternal malaria or in a patient afflicted with maternal malaria. The present sequence represents a P. falciparum varCSA polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a P. falciparum FCR3.varCSA protein, that is capable of binding to choodroitin sulfate A (CSA). The var gene and t corresponding P.falciparum erythrocyte membrane protein 1 (PFEMP1) modulate adhesion of parasitized red blood cell (PREO) to CSA. The protein and the encoding gene are useful for treating and preventing maternal malaria in a patient identified at a risk for contracting maternal malaria or in a patient afflicted with maternal malaria. The present sequence represents a P. falciparum varCSA polypeptide FCR3 var3DBL-gamma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAR70236;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            genetic studies of the chloroquine resistance locus. The 4 genes, EBL-e1 (AAQ83526), E31a (AAQ83527), EBL-e2 (AAQ83528) and Proj3 (AAQ83529), encode the proteins given in AAR70233-36, respectively. The binding domains of such proteins can be expressed e.g. in E. coli, yeast, mammallan, insect, and in vaccinia virus and adenovirus-infected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Erythrocyte binding ligand (EBL) family genes were cloned from P. falciparum chromosome 7 subsegment libraries constructed during genetic studies of the chloroquine resistance locus. The 4 genes, EBL-el (AAQ83526), E3la (AAQ83527), EBL-e2 (AAQ83528) and Proj3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New erythrocyte binding domain polypeptide(s) - Plasmodium binding proteins, used in diagnosis, prevention of malaria

The compositions are for the treatment and prevention of malaria, and comprise either a nucleotide sequence or encoded polypeptide of the var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of genes having homology with conserved regions of DABP and SABP. The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducing a protective immune response in a mammal to plasmodium merozoites (especially Plasmodium falciparum or Plasmodium vivax).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protein (DABP) are soluble proteins that appear in the culture supernatant after infected erythrocytes release merozoites. DABP and SABP mediate the binding of merozoites and schizonts to the erythrocyte surface. These proteins are necessary for erythrocyte invasion by the parasite. This sequence can be used in the compositions of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents Proj3 of Plasmodium. Proj3 belongs to the Duffy binding like (DBL) family of genes which have homology to the Duffy antigen binding protein (DABP) and sialic acid binding protein (SABP) conserved regions (see ANT/2889 and ANT/2888 respectively). The var family of genes modulate cytoadherence and antigenic variation of Plasmodium infected erythrocytes. SABP and the Duffy antigen binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 50-56;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New malaria vaccines - contains cysteine-rich DBL family protein binding domains homologous domains of the Duffy and sialic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to ebl-1 polypeptides that are encoded by the DBL (Duffy-binding like) gene family. The ebl-1 proteins are substantially identical to the Duffy Antigen Binding Protein (DABP) and Sialic Acid Binding Protein (SABP), which are soluble proteins that appear in the culture supernatant after crythrocytes infected with malaria release merozoites. Immunochemical studies indicate that DABP and SABP are the respective ligands for Plasmodium vivax and Plasmodium falciparum Duffy and Sialic acid receptors on erythrocytes. The ebl-1 polypeptides may be used to vaccinate against malaria, especially caused by P. falciparum. Immunization with the polypeptide provides effective protection against polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

                                                                                               the Duffy binding like (DBL) family of genes which have homology to the COLING protein (DABP) and sialic acid binding protein (SABP) conserved regions (see AAT72889 and AAT72888 respectively). The conserved regions of the cytoadherence and antigenic variation of the cytoadherence and antigenic variation of the cytoadherence and antigenic variation of the cytoadherence and schizonts to the erythrocyte supernatant after infected erythrocytes release merozoites. DABP and SABP mediate the binding of merozoites and schizonts to the erythrocyte surface. These proteins are necessary for erythrocyte invasion by the cytoadherence. This sequence can be used in the compositions of the parasite. This sequence can be used in the compositions of the constraint, and comprise either a nucleotide sequence or encoded polypeptide of the var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of genes having homology with conserved regions of DABP and SABP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         XXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                             The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducing a protective immune response in a mammal to Plasmodium merozoites (especially plasmodium falciparum or Plasmodium vivax).

                                            The invention relates to ebl-1 polypeptides that are encoded by the DBL (Duffy-binding like) gene family. The ebl-1 proteins are substantially identical to the Duffy Antigen Binding Protein (DABP) and Sialic Acid Binding Protein (SABP), which are soluble proteins that appear in the culture supernatant after crythrocytes infected with malaria release merozoites. Immunochemical studies indicate that DABP and SABP are the respective ligands for Plasmodium vivax and Plasmodium falciparum Duffy and sialic acid receptors on crythrocytes. The ebl-1 polypeptides may be used to vaccinate against malaria, especially caused by P. falciparum. Immunization with the polypeptide provides effective protection against malaria. The present sequence represents the var-7 polypeptide.

        The invention relates to a P. falciparum FCR3 varCSA protein, that is capable of binding to chondroitin sulfate A (CSA). The var gene and to corresponding P. falciparum erythrocyte membrane protein 1 (PFEMPI) modulate adhesion of parasitized red blood cell (PRBC) to CSA. The protein and the encoding gene are useful for treating and preventing maternal malaria in a patient identified at a risk for contracting maternal malaria or in a patient afflicted with maternal malaria. The

The protein and the encoding gene are useful for treating and preventing maternal malaria in a patient identified at a risk for contracting maternal malaria or in a patient afflicted with maternal malaria. The present sequence represents the P. falciparum FCR3.varCSA protein.
                                                                                                                                                                                                                                                                                                                                      22-SEP-1995

DABP and SABP mediate the binding of merozoites and schizonts to the erythrocyte surface. These proteins are necessary for erythrocyte invasion by the parasite. This sequence can be used in the compositions of the invention. The compositions are for the treatment and prevention of malaria, and comprise either a nucleotide sequence or encoded polypeptide of the var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of genes having homology with conserved regions of DABP and SABP. The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducing a protective immune response in a mammal to plasmodium merozoites (especially Plasmodium falciparum or Plasmodium vivax).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the Duffy binding like (DBL) family of genes which have homology to the Duffy antigen binding protein (DABP) and sialic acid binding protein (SABP) conserved regions (see ANT72889 and ANT72888 respectively). The var family of genes modulate cytoadherence and antigenic variation of Plasmodium infected erythrocytes. SABP and the Duffy antigen binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New malaria vaccines - contains cysteine-rich DBL family protein binding domains homologous domains of the Duffy and sialic acid binding proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents E31a of Plasmodium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Page 43-45; 96pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to ebl-1 polypeptides that are encoded by the DBL (Duffy-binding like) gene family. The ebl-1 proteins are substantially identical to the Duffy Antigen Binding Protein (DABP) and Sialic Acid Binding Protein (SABP), which are soluble proteins that appear in the culture supernatant after erythrocytes infected with malaria release merozoites. Immunochemical studies indicate that DABP and SABP are the respective ligands for Plasmodium vivax and Plasmodium falciparum Duffy and sialic acid receptors on erythrocytes. The ebl-1 polypeptides may be used to vaccinate against malaria, especially caused by P. falciparum. Immunization with the polypeptide provides effective protection against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a P. falciparum FCR3.varCSA protein, that is capable of binding to chondroitin sulfate A (CSA). The var gene and the corresponding P. falciparum erythrocyte membrane protein 1 (PFRMP1) modulate adhesion of parasitized red blood cell (PRBC) to CSA. The protein and the encoding gene are useful for treating and preventing maternal malaria in a patient identified at a risk for contracting maternal malaria or in a patient afflicted with maternal malaria. The present sequence represents a P. falciparum varCSA polypeptide

                                                                                                                                                                                                                                                                                                                                                                         invention are capable of acting as receptors for malaria antigens present on the surfaces of malaria infected erythrocytes, by binding to these antigens the carbohydrates prevent rosette formation by the blood cells, this prevents occlusion of capillaries as is seen in cerebrial malaria caused by Plasmodium falciparum. The products of the invention can be used to treat malaria or to vaccinate against it, or used to design a model to identify compounds that bind to PTEMPI. The carbohydrates, polypeptides and antibodies of the invention can be used as a medicament for dissolving the rosettes formed by erythrocytes infected by a malaria parasite. The products can also be used for detection, diagnosis and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel Plasmodium falciparum erythrocyte membrane protein (EMP), PfEMP1, which is capable of binding to a carbohydrate which exhibits at least one negatively charged glycosamino-glycan (GAG)-like moiety and has antiaggregational, antiocclusional and antimalarial activity. The carbohydrates of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antigen receptor; in
capillary occlusion;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Erythrocyte membrane protein; EMP; PfEMP1; malaria; antiocclusional;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB seq length: 0
